

ASPECTS

Alberta stroke programme early CT score

Types of Stroke

Ischemic stroke: An artery is blocked, and blood supply no longer reaches all the parts of the brain.

Hemorrhagic stroke: A blood vessel bursts or leaks, and blood enters parts of the brain where it would not normally be.

Changes doesn't appear immediately after stroke it takes time to apparent changes to appear in brain.

It takes around 3 hours to see a change in basal ganglia region and could take up to half a day for other changes to become apparent.

MCA Alberta stroke program early CT score (ASPECTS)

Basal ganglia level

Corona radiata level

C: Caudate; IC: internal capsule; L: lentiform nucleus; I: Insular Cortex.

Why above regions

ASPECTS is used for MCA regions.

(B)

Middle Cerebral Artery

MCA (middle cerebral artery) supplies blood to the outer region of the brain.

ASPECT Features

Loss of Gray white matter differentiation

Hypodensity

Sulcal effacement and progressive mass effect
(peaks after 4-7 days)

All these are manifestations of edema, cytotoxic edema.

Involves
both gray
and white
matter

Gray
Matter
preserved

Let's look at some examples

4 Hours

24 Hours

(B)

DAY1

|

DAY10

|

DAY10 MRI

Fogging Effect

Why ASPECTs?

- Easily Applicable: Based on the Plain/Non-contrast CT Head
- Imaging Based: initial imaging modality to screen and diagnose provides an opportunity to quantify the degree of ischemic change.
- Easily Communicated - score out of 10
- Data Driven
- Applicable Worldwide

Value of Non Contrast CT

- Acute Infarcts don't enhance (will exclude intracerebral hemorrhage and lesions that might mimic acute ischemic stroke such as tumor or intracerebral hemorrhage.)
- Can enhance subacutely (vasogenic edema)
- Ischaemic tissue on NCCT appears hypodense because of a combination of reduced blood volume and cytotoxic oedema.
- Dense Vessel Sign (clot detection)
- First-line diagnostic test for the emergency evaluation
- Treatment selection
 - Hemorrhage
 - ASPECTS
 - $\frac{1}{3}$ of MCA territory

Which region shows loss of gray white differentiation?

What issue here?

Which artery system is affected?

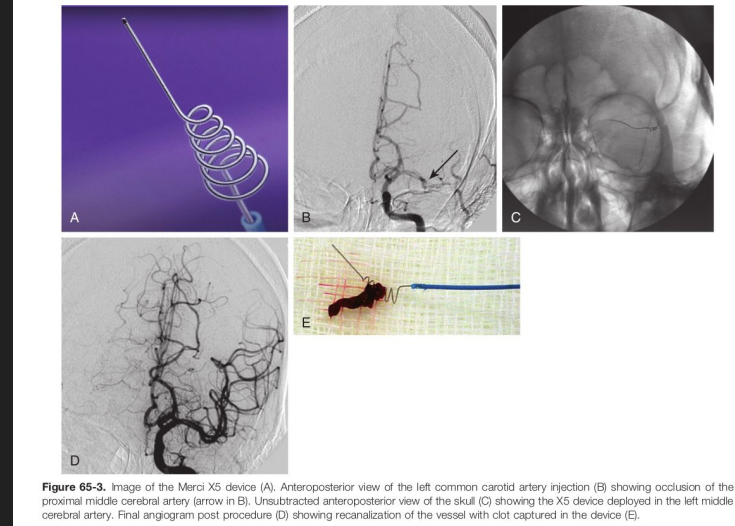

Treatment

ASPECT = 10 (NORMAL)

ASPECT (9-8) rtPA - recombinant tissue plasminogen activator

6 < ASPECT < 8 - Recovery through time, Endovascular treatment

ASPECT < 6 - Generally bad,

Earliest Sign

- Dense Vessel, Vanishing Basal Ganglia, Insular ribbon

Early Sign

- Gray White differentiability lost, hypodensity, sulcii vanishing
